

# Access to the header via Custom Head

Last Modified on 08/21/2024 3:14 pm EDT

If you're looking to add any integrations to your knowledge base, **Custom <head>** is a powerful tool to help you customize your knowledge base.

You can access it using these steps:

1. Go to **Settings > Style**.
2. In the **Customize HTML, CSS, and JS** section, select **Custom <head>**.
3. Paste in any scripts, stylesheets, font files, etc., that may need to be loaded in your knowledge base.
4. Be sure to **Save** your changes.

Here are some of the reasons you might need to use your Custom <head>:

## Script or stylesheet references

Some customizations require adding a script and/or a CSS stylesheet for the integration to work properly; these can be added directly into the Custom <head>. For example, adding an external [syntax highlighter](#) requires you to add both a .js script and a .css stylesheet.

If your organization already has stylesheets that you'd like to reference here, you can also load them straight into the Custom <head>.

## Third-party analytics/tracking tools

Third-party analytics tools like Google Analytics and Plausible or heat map tools like Hotjar typically require a script be added to the Custom <head>. Follow these tools' instructions on what script to add to your knowledge base and, if it needs to be added to the Custom <head>, you have the power to do that!

Refer to [Analytics](#) for more info on getting started with these types of tools. 😊

## Favicon

You don't need to touch the Custom <head> to add a favicon! You can add it directly using **Favicon** option in the left menu. Refer to [Change your favicon](#) for more detailed instructions.
