

# Linked content + suggest API endpoint updates

Last Modified on 12/28/2022 12:24 pm EST

We released some bug fixes for linked content that impacts the content itself as well as the suggest API endpoint.

Linked content is content that is automatically synchronized within KnowledgeOwl--updating it in one place will automatically update it somewhere else. There are three ways to create linked (synchronized) content in KnowledgeOwl:

- Using the "Link content to existing article" option when you create a new article (which allows you to create linked articles within the same or a different knowledge base):

Add Article ×

ⓘ An article is an individual page that shows up in search.

**Article Title:**

New article  
Start from scratch

Create from template  
Start from an existing template

Link content to existing article  
Article body will be shared with an existing article

Copy from existing  
Search for any existing article to use as a starting point

**Search for an existing article:**

**In Knowledge Base:**

- Using the "Shared content" option when you create a new category (allows you to create linked categories between multiple knowledge bases):

Add Category ×

ⓘ A category is a folder or container for articles.

**Category Title:**

**What style of landing page do you want?**

<input type="radio"/> <b>Default</b> Displays articles in a simple list. Choose one of three sub-category display formats.	<input type="radio"/> <b>Topic Display</b> Displays the full text of all articles in a single page. Can only contain articles.
<input type="radio"/> <b>Blog style</b> Display a paginated list of articles with brief descriptions. Can only contain articles.	<input type="radio"/> <b>Custom content</b> Create landing page from scratch like an article.
<input checked="" type="radio"/> <b>Shared content</b> Copy and sync a category and all its contents from another knowledge base.	<input type="radio"/> <b>URL Redirect</b> Navigate end user to another web page when clicked.

**Search for an existing category:**

**In Knowledge Base:**

- And you can create a completely **synchronized copy of a knowledge base**

For all three linked content types, there is a "parent" piece of content (the original), and a "child" (the copy that is synchronized back to that original).

We found and fixed two issues for child content:

- If you use the **suggest API endpoint**, the summary field for child content was previously blank. It is now properly populated.
- If your search results are formatted to use meta descriptions and to show child articles, those meta descriptions were not properly showing up for the child articles' search results before. They are properly showing now.

These updates include security patches.
