Bug fix for default categories with Below Subcategories article display

Last Modified on 12/28/2022 12:24 pm EST

If you have any custom scripts running on category pages, this change may affect you.

This bug fix impacts this scenario:

- **Default category type**
- **Subcategory display type: Title and Description**
- **Article Display Options: Below subcategories (default)**

In this scenario, the URLs for articles displayed had an extra space at the end. Knowledge base navigation handled this properly, but since we do have customers who run some custom logic on these pages, we fixed it so the proper URL is displayed without an extra space at the end.
