

What does merging tags do?

Last Modified on 12/28/2022 12:25 pm EST

In each tag merge, there are two tags:

- The **current tag** (the tag you began the merge from)
- The **new tag** (the tag that will remain when the merge is complete)

Merging will:

- Add the **new tag** to all articles that have the **current tag**
- Remove the **current tag** from all articles
- Delete the **current tag** from the Tag Library

Let's assume I'm using this scenario in my merge:

Merge Tags ×

Current tag:

SSL cert

Merging will replace and delete this tag.

New tag:

ssl certificate

Current tag will be replaced by new tag.

A sample tag merge scenario

SSL cert is the tag I began the edit and merge with.

When I complete the merge:

- That **SSL cert** tag won't exist anymore
- All articles that had **SSL cert** as a tag will have the **ssl certificate** tag
- Articles that had both tags will just get the **SSL cert** tag removed
- Any Manage filters that used **SSL cert** tag as a filter will have the tag removed--you'll need to manually update them to add the **ssl certificate** tag
