

Inherited reader group restrictions now shown in editor

Last Modified on 01/10/2024 12:22 pm EST

For those of you leveraging [Reader Groups](#) to restrict access to content, we have a small but helpful change to the righthand editor options.

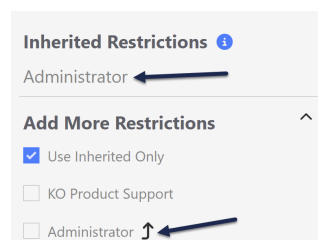

Reader Group restrictions automatically pass from a category into its content. This has always been the case in KnowledgeOwl, but aside from the [CSV export in Manage Articles](#), we've never shown this in the editor. This has made troubleshooting reader group problems somewhat arduous.

Now, for all content below the top-level, the editor shows an **Inherited Groups** section. This section will display any **Restrict to Groups** settings that the content is inheriting. It's not editable in any way; we've just added it to give you increased visibility into which reader groups can see this content.

You won't see this section in any top-level categories or articles, since they have no parent category to inherit restrictions from.

We've also added an up arrow icon next to any inherited groups in the **Restrict to Groups** section.

Here's what the changes look like:

And if you forget most of this release note, never fear--hovering over the question mark icon will give you a tooltip to explain things a bit. 😊

We hope this editor section makes it easier to know when a reader group restriction at a parent category is impacting your content!
