Nat'l ⬚ Anisette Day bug fixes

Last Modified on 01/11/2024 1:31 pm EST

Do you like black licorice or fennel? I sure don't! But if it's up your alley, why not kick off your weekend (responsibly of course) with some Anisette which is a liqueur derived from aniseed popular in Spain, Italy, Portugal, and France. A spoon full of Anisette helps the bug count go down? Sorry, that was a bit of stretch. 😅

We've released fixes for the following bugs:

- In brand new knowledge bases if you tried to embed the **Widget 2.0** version of the help widget before ever saving the **Settings > Widget** page, the widget would run into an error and fail to render. This is no longer the case.
- KnowledgeOwl accounts that are paying by invoice currently need to contact us to increase / decrease / alter the line items of their invoice. On the **Account Settings > Account** page, the "contact us" link on that page was not working (oops!). We have fixed that link and it should now take you to the contact form so you can email us and our team will help you adjust your invoice.
- Previously when a **tag** or a **file label** was deleted from the **Library > Tags / Library > File Labels** interface, we were suppressing them from displaying on any article/category/file that was using it, but we were not completely removing it from the object on the backend. This would have only been noticeable for our power authors when using things like the **API**, but we like our power authors ❤ so we are now completely removing those defunct references.
- In knowledge bases, the search button, download to PDF icon, and the thumbs up/thumbs down icons were missing name and title HTML attributes which are very helpful for people using screen readers. We have now added those attributes. Please contact support if you find any other accessibility issues like these, we make it our priority to fix them whenever they are reported.
- In certain cases, adding a <style> or <script> block to the top of an article's content was causing the css/js code to show as part of the **article blurb** when viewing basic style type categories. We've now made sure that stuff gets stripped out so your customers won't see it.
