

File references now tracked!

Last Modified on 01/30/2024 1:31 pm EST

This feature has been on my personal "please let's build this" list for quite some time, so I'm especially excited to announce that File Library will now track and display **File References** moving forward!

We're now tracking when a file is used in:

- **Articles:** article body, URL redirect, thumbnail, banner
- **Categories:** icon, URL redirect; custom content category body content; thumbnail and banner for the category types which have them
- **Snippets:** snippet body
- **Theme:** Logo in **Settings > Style** or files referenced in any of the Custom HTML templates

These references will be tracked and updated on-save moving forward.

To populate all your existing references, we need to run a one-time reindex on your knowledge base. Please [contact us](#) to run this reindex if you'd like to start using the field right away!

References are visible in **Library > Files:**

- In both Thumbnail and List View when you select an individual file, in the metadata section in the bottom.

Meta data

- image/png
- 106 KB
- [View](#) [Copy Link](#)

References

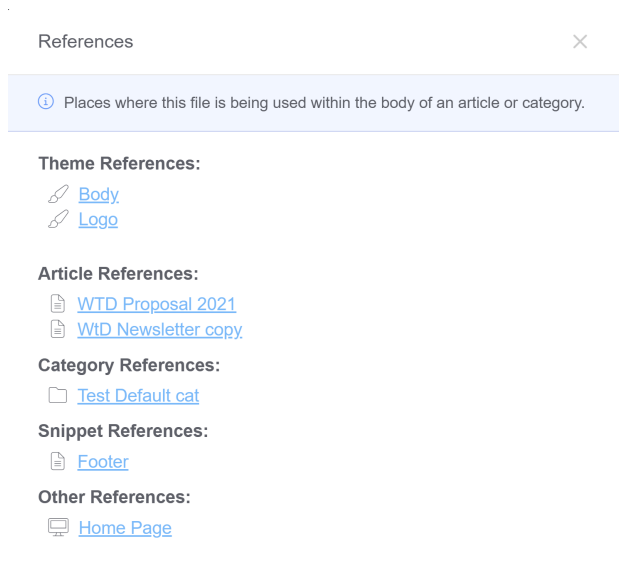

- 1 article reference
- 0 category references
- 0 snippet references
- [View details...](#)

- In List View, References have their own column:

In both cases, the initial display shows you reference counts for certain reference types (article, category, snippet) and will just mention if the file is used in the theme at all.

Once you click **View details**, you'll be able to see a hyperlinked list of all the places the file is actually used. Here's what it might look like if you had all reference types:
