# Automatic Related Articles just got smarter

Last Modified on 06/06/2023 4:13 pm EDT

The **Related Articles** functionality has long supported an "automatically suggest" feature, which will automatically suggest related articles based on title from across the knowledge base.

We've now made those suggestions a little bit smarter: you have the option to only automatically suggest content within the same top-level category as the content you're currently viewing.

Website Settings

Navigation	☑ Enable breadcrumbs
Top navigation	☑ Add a reader login / logout link
Related Articles	☑ Automatically suggest related articles based off of the article titles
	☑ Only automatically suggest articles from the current top level category
	☐ Backward suggest articles which list the current article as related
	If both of these options are enabled, the reverse related articles will be ranked higher.
	Limit list to 6 ⌄ articles

This setting lives in **Settings > Basic** along with the other **Related Articles** options.

So, for example, if we were using that setting here, you'd only see suggestions of other Release Notes.

Depending on your knowledge base's information architecture, this could be a good option to help make sure automatic suggestions are relevant, like if you have one top-level category per product, department, etc. Using this option will guarantee that suggestions are from within the same top-level category.

You can learn more about this new setting in our updated documentation on enabling the feature: **Enable automatically suggested Related Articles.**
