

☒☒ Nat'l Galentines Day bugfixes

Last Modified on 02/13/2025 11:00 am EST

Happy Galentine's Day! I mean, I love a box of chocolates as much as the next guy, but today seems like a much better day to celebrate than that of ol' [Saint Valentine](#), whoever he actually was. February 13th is also National Cheddar Day AND National Tortellini Day. Wowee! So, no matter your gender, I recommend getting together with your fave gal pal(s) and chowing down on some nice cheesy pasta tonight. And beyond pasta, pals and [p'tit quebec](#) - the word gal has a special meaning to me, which I'll share after these release notes for the curious among you.

Here's what we have released lately:

1. **Version note bugs:** We had a few bugs that were all related to [Version notes](#), and they were driving us bonkers. These took us an achingly long time to reproduce so we could figure out how to fix them:
 - a. If an article had a selected version with a multiple line [version note](#), the article editor wasn't working properly.
 - b. The [API](#) `version_note` field was no longer being set or updated.
 - c. Version notes were being wiped upon save when the **Versions** section in the editor was collapsed.

All of these issues are fixed now. Though we are a remote company and I was only reading Slack messages, I felt like I could hear the cries of joy from the team when we finally figured these out.

2. **Disappearing callout expirations:** There was a problem where [article callouts](#) were sometimes saving without expiration dates - meaning they stayed indefinitely, unless manually removed. That's fixed now. To check if any of your articles had this issue:
 - a. Go to **Manage** and [Export the Manage Articles list to CSV](#).
 - b. In the column selections for the export, under **Options**, check the boxes to include **New or Updated Callout** and **Callout Expiration**.
 - c. Review that export for anything with a New or Updated Callout set to "new" or "updated" and an empty Callout Expiration. Edit any articles with the missing Callout Expiration to add an expiration date.
3. **Nested URL redirects in new tabs:** If you had a category set to [subcategory panels](#) and inline article display, nested [URL redirect categories](#) that are set to open in a new tab were opening in the same tab. We've solved the problem, so they should be opening in new tabs if that's what you set :)
4. **Fix YAML uploads:** The incorrect MIME type was being set for uploaded YAML files, which folks use for API docs (among other things). These files were displaying as `application/octet-stream` which is incorrect. They now display as `application/YAML` like they ought to.

5. **Changes to Search settings:** We have released an experimental version of an AI-assisted semantic search to a handful of customers so they can test it out as we work more on it, before giving it a wider release. Already, though, folks should see a few changes in our [regular keyword search](#):

- a. You can now [choose which fields](#) are indexed for autosuggest and full search, which gives you much more control over the search results.
- b. There are now more detailed [fuzzy \(i.e. typo tolerant\)](#) search settings. For example, you can set the fuzzy starting point and/or disable fuzzy search for full page search results.

That wraps up our bug release note.

In some get-to-know-your-Success-Owl-Erica bonus content, I thought I'd tell y'all about GAL, and what it means to me. [Girls' Art League](#) (GAL) was [is?]* a non-profit I founded 11 years ago in Toronto. We did a lot of great work, with so many amazing humans, empowering folks through visual art.

*it's on hiatus, but with plans of returning in late 2026.
