⊠ Nat'l Cheddar day bugfixes

Last Modified on 02/12/2026 8:47 am EST

Cheddar maybe isn't the most glamorous of cheeses, but it's a staple for a reason. This versatile and tasty friend pairs well with so many things. Recently, KnowledgeOwl's Chief Executive Owl Marybeth shared with me a game-changing use of cheddar. This New York Times recipe for Tomato Cheddar Toast. It's simple, it's alarmingly fluffy and delicious, and it's a sure way to improve any day, National Cheddar Day, or not.

In the spirit of improvement, let me share the bugfixes & improvements we have recently released:

Glossary headaches no more

We had a bug where new glossary definitions were not indented on the Glossary page, and the older ones were. This inconsistency in formatting has now been resolved, and your Glossary should look as lovely as ever:

There was an issue occurring when folks tried to turn off or on the link to their Glossary within their Table of Contents. The update (off or on) would not be visible without first busting the cache! This has been fixed, so now you should see (or not see) your Glossary within your table of contents immediately after changing that setting.

□

Snippet rendering optimization

One of our beloved customers had a massive article that took ages to load. We jumped in to try to help them with this. In the process, we ended up doing a massive optimization of how quickly snippets will be rendered in KnowledgeOwl. If you have articles that are using a lot of Snippets, you should see them being much zippier than before.

Owl Analytics now lets you track AI agents as referrers

We've made a recent improvement to Owl Analytics that lets you track AI agents as referrer types. You can see these details within reports that include referrers, like the Transitions report and the Logs report.
