Export API quickstart

Last Modified on 03/19/2026 11:51 am EDT

The Owl Analytics Export API endpoint is `https://app.knowledgeowl.com/analytics/data` .

You must pass your knowledge base ID (`project_id` **), a start date (** `start_date` **), and an end_date (** `end date` **) to return data.**

Choose from three reports to export:

- **Overview report: Don't specify a** `report` **parameter**
- **Logs report: Set** `report=visits`
- **Readers report: Set** `report=users`

You can also set the `format` **parameter to choose between xml or csv format for your export. Refer to Which report format do I need? for some information about report formats and their uses.**

There are three ways you can call the Owl Analytics Export API:

1. **A curl call**

2. **In your browser's URL**

3. **Using an API call tool. We provide instructions and a forkable collection for Postman but you could use the guidelines here to set up a similar tool.**

We provide examples or setup instructions for each below.

> **Full API endpoint documentation**
> Refer to our **Owl Analytics Export API endpoint** documentation for information on the parameters and formats the endpoint expects.

curl call

You can use a curl call in Terminal to export report data.

Use this sample format to call the Export API via curl:

```
curl -u "{export_token}:X" -X GET "https://app.knowledgeowl.com/analytics/data?project_id={knowledgebase_id}&start_date={yyyy-mm-dd}&end_date={yyyy-mm-dd}&format={format}"
```

For example, if we wanted to pull the Logs report for 4 March 2026 in xml format, our call would look like this:

```
curl -u "{export_token}:X" -X GET "https://app.knowledgeowl.com/analytics/data?project_id={knowledgebase_id}&start_d
ate=2026-03-04&end_date=2026-03-04&format=xml&report=visits"
```

Refer to our **Owl Analytics Export API endpoint** documentation for information on the parameters and formats the endpoint expects.

Browser URL call

For quick testing to view the report in your browser, hit the endpoint directly in your browser's address bar. Use the **Copy sample endpoint** option in **KB settings > Owl Analytics** to get started or copy one of the samples below.

> **Use with caution**
> This approach does pose a potential security risk since it exposes your API key in the URL. Refer to our **Export API token best practices** for more detailed guidance.

Here's a sample format for the URL:

```
https://app.knowledgeowl.com/analytics/data?project_id={knowledgebase_id}&start_date={yyyy-mm-dd}&end_date={y
yyy-mm-dd}&format=xml&api_key={export_token}
```

CSV results should display in any browser; XML results will display in Chrome but may not display in all browsers.

For example, if we wanted to pull the Readers report for the week of 1 - 7 March 2026 in csv format, our call would look like this:

```
https://app.knowledgeowl.com/analytics/data?project_id={knowledgebase_id}&start_date=2026-03-01&end_date=2026-
03-07&format=csv&report=users&api_key={export_token}
```

Refer to our **Owl Analytics Export API endpoint** documentation for information on the parameters and formats the endpoint expects.

Postman call

To use a tool like **Postman** to make this call:

1. Use **Basic Authentication** as your **Authorization**.

2. Enter your export token as the username.

3. Enter `x` as the password.

Refer to our **Owl Analytics Export API endpoint** documentation for information on the parameters and formats the endpoint expects.

Postman collection

If you already use Postman, save yourself some time and fork our collection below, which includes the correct authorization setup and all the parameters you'll need:

Once you've forked the collection, set up an environment for the three variables the collection uses:

1. In Postman, select the **Environment** dropdown in the upper right. If you're new to environments, it will say **No environments**.

    a. Refer to Postman's **Group sets of variables in Postman using environments** documentation if you've never worked with environments in Postman before.

2. Select **Create Environment** to create your first environment or select the **+ (plus)** sign if you already have some.

3. Call the new environment something like `Owl Analytics Export API`.

4. In that environment, set up three **variables**:

    a. `api_key` : Copy your **account export token** from **KB settings > Owl Analytics > Export API** and enter it as this variable's value.

    b. `password` : **Enter the letter** `x` .

    c. `knowledgebase_id` : **Open your knowledge base in app.knowledgeowl.com. On the Articles page, copy the number that comes after** `/id/` **in the URL. Enter this as the value for this variable. Refer to** **Find your knowledge base ID or project ID** **for more detailed instructions.**

5. Your environment should look a bit like this:

> **Sample Owl Analytics Export API environment in Postman**

6. **Save** those environment changes.

Now open your **Owl Analytics Export API** collection.

In the environment dropdown at the upper right, select the environment you just created.

We also recommend pinning this environment to the connection by selecting the pushpin icon:

> **Select this environment but also pin it to the collection, so it defaults to this environment in the future**

Refer to Postman's **Pin environments to collections** for more detailed instructions on pinning an environment to a collection.
