

## **New: Customize your llms.txt file**

Last Modified on 06/18/2025 1:44 pm EDT

You can now create [llms.txt](#) directly within KnowledgeOwl to help AI better understand and surface your help content when users ask questions.

[llms.txt](#) is an emerging standard that provides a plain-text, Markdown-formatted overview of a website for large language models (LLMs) to read. It's basically the [robots.txt file](#) for AI tools.

When an AI tool visits your knowledge base, it reads your [llms.txt](#) file to get a structured summary of your content, such as your knowledge base's purpose, key sections, and links to important pages, rather than having to crawl and interpret everything from scratch.

Visit our [full documentation](#) of the feature to see how to set up [llms.txt](#) for your knowledge base, including a quick start guide and examples you can use.
